

## The Great Migration

### **The Monthly Migratory Patterns**

Due to varying weather conditions and other such factors, the Migration can differ in its location at any time of the year. However a general prediction for the Migratory pattern month-by-month can be summarised as follows:

**In January** herds of the wildebeest are to be found in the southern Serengeti on the short-grass plains

**In February** the Migration has spread out across the short-grass plains of the southern Serengeti

**In March** the Migration is now spread across southern Serengeti, Loliondo and Ngorongoro Conservation Area

**In April** the migrating herds start moving north through the areas of the Moru Kopjes and Seronera

**In May** the Migration heads north through Seronera towards the Western Corridor

**In June** the Migration collects in the area of the western corridor before crossing the Grumeti River

**In July** the Migration continues to cross the Grumeti and across the Grumeti Reserve

**In August** the Migration continues up into the far north-west of the Serengeti National Park

**In September** wildebeest herds in the north of Serengeti National Park and in the Maasai Mara

**In October** wildebeest grazing in the far north of the Serengeti - and across in the Mara

**In November** the Migration starts its first trek south through Loliondo and via the eastern extremities of the Serengeti National Park

**In December** the Migration arrives at the short-grass plains, in time for the rains
